

MONITORING FOR CEREBRAL VASOSPASM AFTER ANEURYSMAL SUBARACHNOID HAEMORRHAGE (SAH)
'SAVE' signs or symptoms may be present without a change in GCS

S	S evere persisting headache resistant to analgesia S ubtle changes in speech – <i>Is patient able to name objects?</i>
A	A rm drift – <i>Is patient able to equally maintain both arms outstretched, palms upwards with eyes closed?</i>
V	V isual acuity – <i>Is patient able to read as well as prior to SAH?</i>
E	E levated BP – <i>Is BP elevated?</i> <i>(Sudden rise in BP often premonitory sign of vasospasm)</i>
<i>If any SAVE sign or symptom present inform nurse in charge / medical team immediately & increase frequency of observations. Also escalate if patient has a change in behavior, such as VAGUENESS, AGITATION or CONFUSION.</i> <i>Monitor more closely if patient's relatives report any change.</i>
